                                                                                                                                                                                                                                                                                                             ÷
                                                                                                 The present invention describes a method of producing humanised immunoglobulins involving expressing in a cell a nucleic acid encoding a humanised version of an immunoglobulin. This is obtained by comparing a donor and human immunoglobulin and producing a combined antibody which contains part of each. These are useful in the treatment of graft-versus-host disease, transplant rejection, autoimmune diseases such as diabetes, rheumatoid arthritis, myasthenia gravis, multiple sclerosis and systemic lupus erythematosus, herpes infections. CMV virus infections and myeloid leukaemia. THe present sequence is an antibody cDNA used to demonstrate the method of the invention.

This cuphs sequence codes for the light chain variable receptor (18 cee AAW84094) of the anti-human alpha v beta-3 vitronectin receptor murine monoclonal antibody D12. It was obtained from hybridoma total RNA by RT-CR using mouse kappa and N-terminal-based primers (see AAV71808-09). A heavy chain variable region clone (see AAV71797) as also been identified. D12 VH and VL show sequence similarity to Kabat VH subgroup I (see AAW84095) and Kabat VK subgroup III (see AAW84096), respectively. Humanised VH (see AAW84097) and VL see AAW84098) were constructed by combining the framework regions of the human v region consensus sequences with complementarity determining regions of D12 (Keeping some preferred murine framework residues). The humanised antibodies are specifically reactive with the human alpha-v beta-3 protein receptor and capable of neutralising the receptor. They can be used for passive immunotherapy of a disorder mediated by the alpha-v beta-3 receptor, e.g. cardiovascular cassociated with diabetic retinopathy, atherosclerosis and cancer, e.g. solid tumour metastasis, and diseases where bone resorption is associated with pathology such as osteoprorsis, hyperparathyroidism, Paget's disease, hypercalcenae corrections, preparathyroidism, Paget's disease, hypercalcenae corrections and diagnosis. Corrections and diagnosis, promine deficiency. They can also correct correction and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 CTTTCCTGCCAGCCAGCCAAAGTATTAGCAACCACCTACACTGGTATCAACAAAGGCCT 120

used for treating Verotoxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        light chain variable region framework. Such humanized antibodies (see AAY32406-07) have an affinity for VT2 that is 3-, 5 or 10-times that of MuVTml-1. They are used for treating a patient suffering from, or at risk of, the toxic effects from VT2 (claimed), especially for treating verotoxin producing Escherichia coli (VTEC) infection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          that are capable of neutralizing VT2 and/or VT2 variants. The humanised antibody is a humanized form of MuVTm1-1 comprising the complementarity determining regions of MuVTm1-1 and heavy and light chain variable region frameworks from the human GF4 antibody heavy and light chain frameworks, provided that at least 1 position selected from L49, H30, H49 and H98 is occupied by the amino acid at the equivalent position of the MuVTm1-1 antibody heavy or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This DNA sequence codes for the light chain variable region (see AX723405) of murine monoclonal antibody VTmL-1 (WMVTml-1), an antibody that specifically binds to the B subunit of verotoxin II (VT2). The invention relates to humanised antibodies against VT2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vasques

AAA AAA43926 to AAA45925 represent specifically claimed secreted expressed sequence tags (sESTs), isolated from human, mouse, chicken and rat tissue sources. The sESTs can have a range of activities depending on the tissues they were isolated from. The activities include: Chemotactic; proliferative; immunomodulatory; haematopoietic; chemotactic; antibacterial; antifungal; antiviral; antidiabetic; antibacterial; antidiagl; antiviral; antidiabetic; cytostatic; antipackinsonian; antipackinsonian;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó:

Patent No. 6072035
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Hardman, No. 6072035man
APPLICANT: Kolbinger, Frank
APPLICANT: Saldanha, Jose
TITLE OF INVENTION: Reshaped monoclonal antibodies against an
TITLE OF INVENTION: immunoglobulin isotype
NUMBER OF SEQUENCES: 55
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ő

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                               This sequence reperesents the vitaxin antibody variable light chain region. Vitaxin and the antibody LM609 bind selectively to integrin alphavbeta3 and can be used to inhibit binding of alphavbeta3 to a ligand and thus block integrin-mediated signal transduction. This is useful in the treatment, prevention and diagnosis of alphavbeta3-mediated disease, specifically anglogenesis and restenosis (but also e.g. (non-)immune inflammation, diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid arthritis, macular degeneration, osteoporosis etc.). The antibodies contain non-murine framework regions so are suitable for use in humans. Enhanced types of LM609 have affinity more than 90 times greater than that of parent the parent antibody.
                                                                                                                                                                                                                                                                                                                                                                                                      ö

```
This sequence represents a LM609 grafted antibody variable light chain region. LM609 and the antibody vitaxin bind selectively to integrin alphavbeta3 and can be used to inhibit binding of alphavbeta3 to a ligand and thus block integrin-mediated signal transduction. This is useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vitaxin; antibody; variable region; heavy chain; light chain; integrin; LM609; inhibitor; integrin-mediated signal transduction; treatment; diagnosis; anglogenesis; restenosis; inflammation; diabetic retinopathy; neovascular glaucoma; cancer; psoriasis; rheumatoid arthritis; murine; macular degeneration; osteoporosis.

the treatment, prevention and diagnosis of alphavbeta3-mediated disease, specifically angiogenesis and restenosis (but also e.g. (non-)immune inflammation, diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid arthritis, macular degeneration, osteoporosis etc.). The antibodies contain non-murine framework regions so are suitable for use in humans. Enhanced types of LM609 have affinity more than 90 times greater than that of parent the parent antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Enhanced LM609 grafted antibodies exhibiting selective binding affinity to alpha(V)beta(3) integrin, useful in the diagnosis and treatment of angiogenesis, inflammatory diseases e.g. psoriasis, cancers and

Murine CDRs were used in a human Wol framework to produce a pure humanised immunoglobulin (Ig) which is capable of binding to the 9H glycoprotein of cytomegalovirus. The Ig is non immunogenic, due to the human framework, and has a strong affinity for its predetermined antigen. They can be produced in large quantities via recombinant DNA and monoclonal antibody technology. The humanised Igs may be used alone or in combination with chemotherapeutic agents such as non-steroidal anti-inflammatory drugs or immunosuppressants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New immunoglobulin(s) having murine CDRs in human framework regions - have lower antigenicity; useful for treating e.g. HSV, CMV, T-cell disorders, myeloid disorders and auto-immune

This is obtained by comparing a donor and human immunoglobulin and producing a combined antibody which contains part of each. These are useful in the treatment of graft-versus-host disease, transplant rejection, autoimmune diseases such as dlabetes, rheumatoid arthritis, myasthenia gravis, multiple sclerosis and systemic lupus erythematosus, herpes infections, CMV virus infections demonstrate the method of the linvention.

This is obtained by comparing a donor and human immunoglobulin and producing a combined antibody which contains part of each. These are useful in the treatment of graft-versus-host disease, transplant rejection, autoimmune diseases such as diabetes, rheumatoid arthritis, myasthenia gravis, multiple sclerosis and systemic lupus erythematosus, herpes infections, CMV virus infections demonstrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Humanised immunoglobulin; mouse; human; antibody; heavy chain; diabetes; light chain; graft versus host disease; transplant; autoimmune disease; multiple sclerosis; zheumatoid arthritis; systemic lupus erythematosus; myasthenia gravis; herpes infection; myeloid leukaemia; CWV infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the amino acid sequence of the light chain variable region (VL) of humanised anti-alpha-v beta-3 vitronectin receptor monoclonal antibody DIPIZHC 1-0. It is based on the VL sequence (VL) of human Rabba subgroup III kappa chain, with complementarity determining regions (CDRs) from the murine anti-human alpha-v beta-3 vitronectin receptor monoclonal antibody DI2 (see AAW84093). 3 Murine framework recidus (1, 49 and 60) are retained. The humanised light chain can be expressed in host cells using nucleic acid molecules (see AAW4090) of the invention. Humanised DI2 VH is also provided (see AAW44097)). The humanised antibodies can be used for passive immunotherapy of disorders mediated by the alpha-v beta-3 receptor, e.g. cardiovascular or angiogenic-related disorders, such as anglogenesis associated with diabetic retinopathy, atherosclerosis and restenosis, chronic inflammatory disorders, macular degeneration, rheumatoid arthritis and cancer, e.g. solid tumour metastasis, and diseases where bone recorders and responsesis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the amino acid sequence of the region of the murine monoclonal antibody (MAb) D12 light chain variable region (VL) that is altered in humanised D12 VL (see also AAW8409B). A synthetic gene (see AAV81902) encoding the protein was prepared from synthetic oligonucleotides and used to prepare an expression vector for humanised D12 VL. D12 is an anti-human alpha-v beta-3 vitronectin receptor MAb. Humanised D12 MAbs can be used for passive immunotherapy of disorders mediated by the alpha-v beta-3 vitronectin receptor, e.g. restenosis and angiogenic associated

The MAD, or a fragment, can be used to inhibit the growth of tumour cells, especially late stage prostatic tumour cells in humans, optionally conjugated to a cytotoxic agent, especially doxorubicin, taxol or cisplatin, or a signal transduction, ras or cell cycle inhibitor.
                                                                                                                                                                                                                                                                         Kappa; light chain; reshaped; monoclonal; antibody; 225RA; human; epidermal growth factor; EGF; receptor; inhibition; growth; tumour; cell; late stage; prostatic; prostate; variable region; framework; complementalty determining region; CDR.
